

Directory Structure: www.MyPets.com

The thing to remember is that navigation within the directory tree involves going from one HTML page to another, and when an HTML document is on the same "level" with other folders, it can go directly into one of those folders to link to another page.

In this diagram, anything with the same vertical placement is on the same "level". But do not confuse files that are on the same level with files and folders that are on the same level. File paths not on the same level always need to get into a folder to get to the other file, and this will always involve a `../` or a `/` in the path.
